

Protect Our Waters

Non-renewable energy

Close to **90%** of Alberta's electricity is generated from fossil fuels.

- Fossil Fuels
- Renewable Energy

Coal Mining

There are nearly **1000** active coal lease applications targeting headwaters in the mountains and foothills of Alberta.

The result

Toxic concentrations of selenium that are released into the water cause irreversible damage to mammals, birds, and fish.

Our Water

Headwaters are considered the starting point of all rivers and streams. **90%** of Alberta's drinking and irrigation water comes from Alberta's mountain headwaters.

Renewable energy

Alberta is the leading producer of wind energy in Canada and wind capacity is projected to continue growing. Protect our headwaters against open-pit coal mining and advocate for renewable energy options.
